### ALIGNMENTS

New proteins derived from T4 phage tail fibre proteins - that can self assemble into nano-structure(s), useful as filters etc, also corresponding DNA corresponding DNA protein (R97371) of unspecified function is the product of open reading frame X of the tail fibre protein gene region (see also T29053) of phage T4. This gene region also includes open reading frames for tail fibre proteins (see also R97370 and R97372-74). Tail fibre proteins (see also R97370 and R97372-74). Tail fibre proteins (active or modified) can be produced in large quantities in microbial cells and used as building blocks of strong, stable nanostructures. 07-JAN-1997 (first entry)

polypeptide(s) useful in vaccines to treat or prevent H. pylori polypeptide(s) useful in vaccines to treat or prevent H. pylori claims 14,80; Pages 850-851; 1145pp; English.

This is a H. pylori call envelope outer membrane protein having a C-terminal tyrosine cluster motif. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or linhibitors. The DNA and probes derived from it may be used for the identification of H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of
                                                                                                                                                                                                                                                                                                                   New isolated mycobacteria polypeptides and nucleic acids - used for developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis claim 1: Page 188-190; 163pp: English.

The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, sequence 591 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylorispecific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  interest, particular regions can be isolated from n. pyror, wy the amplification for recombinant polypeptide production, e.g. in E. coli

Laim 9: Page 123-125: 184pp: English.

This is the amino acid sequence of a 76 kDa Helicobacter pylority polypeptide designated GHPO 185. It was deduced from an isolated polypeptide designated GHPO 185. It was deduced from an isolated genomic DNA sequence (see V07919). The invention provides a family of 76 kDa Helicobacter polypeptides (see W73012-312), as well as a 12 kDa polypeptide (see W73014) and a 50 kDa polypeptide (see W73015), and methods for producing the unprocessed or mature polypeptides in host cells. The polypeptides on methods in host cells. The polypeptides on methods and products of the invention allow treatment and prevention of gastroducdenal diseases associated with Hb infections, including acute, chronic, and atrophic gastritis, and not diagnostic methods are also provided.

Thimmaric gene imparting resistance to two or more herbicides - such as hydroxyphenylpyruvate dioxygenase inhibitors, also related vectors and transformed plants

Y vectors and transformed plants

Disclosure; Fig 1: 4Ppp: French.

The invention relates to the generation of transgenic plants resistant to preferably at least 2 herbicides by introducing a chimaeric gene comprises at least 2 gene subunits where one sequence encodes hydroxyphenylpyruvate dioxygenase (HPPD), an enzyme that promotes to learnee to herbicides such as isoxaflutole or sulcotrione. This sequence was used to derive the degenerate primers sequence (V19280). This in turn was used to derive the degenerate primers (V19270-V19274) for the isolation of the HPPD gene from P. fluorescens strain A32 (V19269). The plants, e.g. tobacco, cotton, rape, soya,
                                                                                                                                                                                             N-Garawi A, Kleanthous H, Lissolo L, Miller C, Tomb J;

New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter products for the amino acid sequence of a 76 kDa Helicobacter pylori polypeptide designated GHPO 190. It was deduced from an isolated genomic DNA sequence (see V07918). The invention provides a family of 76 kDa Helicobacter polypeptides (see W73022-32), as well as a 3 kDa polypeptide (see W73034) and a 50 kDa polypeptide (see W73035), and also polynucleotides (see V72001, V07912-21 and V07963-64) encoding them, expression cassettes, and methods for producing the unprocessed or mature polypeptides in host cells. The polypeptides can be used in vaccination methods to prevent or treat Hb infection in a mammal. Methods and products of the invention allow treatment in the prevention of gastroduodenal diseases associated with Hb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Example 1: Fig 3: 26pp; French.

Example 1: Fig 3: 26pp; French.

C dioxygenase (HPPD) gene sequence from Pseudomonas sp. PJ874 and were used to amplify fragments of the HPPD gene of P.fluorescens

C A32. The present sequence was deduced from the insert of one positive clone and it has 92% identity to the known PJ874 HPPD protein. The coding sequence can be used to generate transgenic plants which are resistant to the isoxazole or di- or tri-ketone family of herbicides, especially 4-[4-CF3-2-(methylsulphonyl) benzoyl]-5-cycloppropyl isoxazole or sulcotrione.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptococcus pneumoniae spo/rel distal terminal portion.

The present sequence is the distal terminal portion of a spo/rel protein (spor/relA family) from Streptococcus pneumoniae. The protein is of the spor/relA family) from Streptococcus pneumoniae. The protein is of the spor/relA family, which, in Escherichia coli, is involved in the stringent response to nutrient limitation and regulate the accumulation of (p)ppdpp which is involved in the regulation of gene expression and other cellular processes. Spo/rel proteins have a homology to e.g. S. equisimilis rel protein. Spo/rel proteins can be used: (a) in the treatment of an individual in need of spo/rel protein, by administering to the protein to the patient; (B) in the treatment of an individual in need of spo/rel protein, by administering an antagonist which inhbits the activity of the protein; and (C) for inducing an immunological response by inoculating the mammal with spo/rel protein, or a fragment or variant of it, adequate to produce antibody and/or T cell immune response to protect the animal from disease. Conditions which may be treated include otitis media, conjunctivitis, pneumonia, bacteriamia meningits, sinustis, pleural empyema, endocarditis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure: Fig 2; 13pp; English.

Protein may be produced in a transformed cell-line defficient in b-alanine production. The cell will then express the required sequence and a second sequence operably linked to the D-alanine racemase. Other sequences which may be used in the same way include those
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      bacteraemia, meningitis, sinusitis, pleural empyema, endocarditis and especially meningitis and compositions may be used as antibacterials. Disclosure: Page 31-33; 49pp; English.

The protease gene is to be modified in order to render it (partially) incapable of producing the natural protein; or result in a nonfunctional protease or in a protease with modified proteolytic activity. The modifications can be introduced in vitro or in situ by standard genetic engineering technqiues or by exposure to mutagenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This polypeptide comprises human CDP-diacylglycerol synthase (hCDS), or CTP:phosphatidate cytidylyltransferase, an enzyme that converts phosphatidic acid to CDP-diacyl-glycerol, a precursor of phosphatidylinostiol, phosphatidylglycerol and cardioliphn. Its amino acid sequence was deduced from an isolated cDNA clone (see V09944). It shows homology to Drosophila CDS (see W3929), yeast CDS and E. coli CDS. hCDS polypeptides can be obtained by chemical synthesis or by recombinant expression. A claimed method for screening drug candidate componds having activity as antinifammatory agents, for increasing haematopoiesis, and preventing reoxygenation injury following cytoreductive therapy involves contacting a CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-PSDB; V09944.

Nucleic acid encoding human CDP-diacyl-glycerol synthase and related proteins - used to identify compounds that are antiinflammatory, increase haematopoiesis or prevent re-oxygenation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               06-JUL-1998 (first entry)

The present sequence represents a spo/rel protein (spoT/relA family) from Streptococcus pneumoniae. The protein is of the spoT/relA family, which, an Esteptococcus pneumoniae. The protein is of the spoT/relA family, which, an Esteptococcus pneumoniae. The protein is of the spoT/relA family, which, and spot in Esteptical coli, is involved in the stringent response to nutrient limitation and regulation of gene expression and other cellular processes.

Spo/rel proteins have a homology to e.g. S. equisimilis rel protein. Spo/rel proteins can be used: (a) in the treatment of an individual in need of spo/rel protein, by administering to the protein to the patient; (b) in the treatment of an individual having need to inhibit spo/rel corporating an antagonist which inhibits the activity of the protein; and (c) for inducing an immunological response by concert the mammal with spo/rel protein, or a fragment or variant conflucted the mammal from disease. Conditions which may be treated include otilis media, conjunctivitis, pneumonia, becteraemia, meningitis, shown in the include otilismus and sepecially meningitis and compositions may be used as antibacterials.
                                                                                                                                                                                                                                                     ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ÷

Polypeptide(s) - useful in vaccines and encoused

polypeptide(s) - useful in vaccines to treat or prevent H. pylori

infection and for diagnosis of H. pylori infection

PS Claim 14; Page 576-577; 1145pp; English.

This sequence is a H. pylori protein of unspecified function.

The protein may be used in a vaccine to prevent or treat H. pylori

infection or to identify H. pylori polypeptide binding compounds,

conseful as potential H. pylori life cycle activators or inhibitors. The

CNA and probes derived from it may be used for the identification of

H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic

CNA and probes derived from it may be used for the identification of

H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic

CNA and probes complementary to the DNA act as antisense sequences and

CA and distribution of H. pylori-specific antigens. The genomic sequence

CA and distribution of H. pylori-specific antigens. The genomic sequence of

CA pylori (ATC 55679) was determined from overlapping contigs generated

CA pylori (ATC 55679) was determined from voralapping contigs generated

CA pylori (ATC 55679) was determined from voralapping contigs generated

CA pylori (ATC 55679) was determined from voralapping contigs generated

CA pylori (ATC 55679) was determined from voralapping contige by mechanically shearing the bacterial DNA. The sequences were analysed

CA of ORF of at least 180 nucleotides, and the predicted from various ORF

CA of ORF of a least 180 nucleotides and determined the sequences of

CA of ORF of a maino acid sequences predicted from various ore

CA of or ore proteins. Having identified and determined the sequences of

CA or ore proteins. Having identified and determined from various ore

CA or ore proteins. Having identified and determined from the sequences of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

PT polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection

C Tains 14,80; page 721-722; 1145pp; English.

C This sequence is a H. pylori cell envelope outer membrane protein which is stated to have a terminal Phe residue.

CC The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, consetul as potential H. pylori life cycle activators or inhibitors. The protein can be used from it may be used for the identification of for H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies and distribution of H. pylori's pecific antigens, The genomic sequence of M. pylori (ATCC 55679) was determined from overlapping contigs generated for ORF of at least 180 nucleotides, and the predicted coding regions of defined by computer evaluation. To identify 1kkely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest particular regions can be isolated from H. pylori by PCR can amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 31.468; Variance 47.304; scale 0.665

SUBMITTED (MAY-1996) TO EMBL/GENBANK/DDBJ DATA BANKS.
-!- FUNCTION: DNA-DEPENDENT RNA POLYMERASE CATALYZES THE TRANSCRIPTION OF DNA INTO RNA USING THE FOUR RIBONUCLEOSIDE TRIPHOSPHATES AS
                                                                     RNA(N).
SUBUNIT: RNA POLYMERASE II CONSISTS OF 12 DIFFERENT SUBUNITS.
THIS SUBUNIT IS THE SECOND LARGEST COMPONENT OF RNA POLYMERASE II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SIMILARITY: COAT PROTEINS FROM CÁRMOVIRUSES (CARMY, MNSW, TCV), DIANTHOVIRUSES (RCNMV), SOBEMOVIRUSES (MCMV, SBMV), TOMBUSVIRUSES (AMCW, CNV, CYRSV, AND TBSV), AND TNV ARE RELATED IN THEIR S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NUTTER R.C., SCHEETS K., PANGANIBAN L.C., LOMMEL S.A.,

PLANT MOL. BIOL. 22:379-3811993).
-!- FUNCTION: CYTOCHROMES P450 ARE A GROUP OF HEME-THIOLATE MONOOXYGENASES. MAY BE A GERANIOL-10-HYDROXYLASE.
-!- CATALYTIC ACTIVITY: RH + REDUCED FLAVOPROTEIN + O(2) - ROH + OXIDIZED FLAVOPROTEIN + H(2)0.
-!- PATHWAY: INDOLE ALKALOID SYNTHESIS.
-!- SUBCELLULAR LOCATION: MEMBRANE-BOUND.
-!- SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PFAM; PF00067; p450; 1.

This sequence represents a Streptococcus pneumoniae protein of unknown the invention provides DNA sequences (V6201 to V6304) from the Streptococcus pneumoniae genome and corresponding protein sequences (W80605 to W80728). The protein sequences are classified as hypothetical (cell wall biosynthetic, external target, or minimal gene set proteins. A recombinant host containing a vector comprising any of the above nucleic acids can be used for the recombinant expression of the proteins. The pair fragment of any one or more of these DNA sequences. The DNA chip can be used may not any or the proteins of the protein of the proteins of the protein of the protein of the protein of the protein of the companies of these by pneumoniae and for identifying virulence genes in S. pneumoniae. Antibodies that selectively signed to the above proteins or peptide fragments can be used to treat S. pneumoniae cells.
Streptococcus pneumoniae protein; recombinant; gene expression; DNA chlp; virulence; antibody; infection; detection; treatment; hypothetical; cell wall biosynthetic, external target; minimal gene set protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and transformed yeast Claim 14; Page 10; 41pp; English.

A DNA construct has been developed encoding a polypeptide and has the formula given below, components in parentheses may be omitted:

SP-LP-(PS)-(9)-(PS)-gene (1); where SP = sequence encoding a signal peptide; LP = sequence encoding synthetic leader peptide without any wilnked glycosylation; PS = sequence encoding a protease processing site; S = sequence encoding a spacer peptide; gene = sequence encoding a polypeptide. Also described are: (1) an expression cassette (EC) comprising (1), fused to a 5'-promoter and 3'-terminator; (2) a yeast expression vector containing (1); (3) a yeast cell containing the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New DNA construct containing synthetic leader sequence with no N-linked glycosylation - for high yield and efficient expression and secretion of proteins, e.g. insulin, in yeast, also related vectors
                                                                                                                                                                                                                                                                                                                   Streptococcus pneumoniae nucleic acid sequences - used in DNA chips for evaluating gene expression, and identification of virulence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  05-NOV-1998 (first entry)
Leader peptide sequence TA75.50.
YAP3 signal peptide; synthetic leader peptide; construct; yeast; insulin; insulin-like growth factor; glucagon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DB 36; Length 130;

Claim 11; Page 31-32; 40pp; English.

The present sequence is the distal terminal portion of a spo/rel

C the present sequence is the distal terminal portion of a spo/rel

C for the spoT/relA family, which, in Escherichia coli, is involved in the spoT/relA family, which, in Escherichia coli, is involved in the spoT/relA family, which, in Escherichia coli, is involved in the coli is involved in the regulation of gene expression and other cellular processes. Spo/rel proteins have a homology to e.g.

S. equisimilis rel protein. Spo/rel proteins can be used: (a) in the treatment of an individual in need of spo/rel protein, by administering to the protein to the patient; (B) in the treatment of an individual lawing need to inhibit spo/rel protein, by administering an antagonist which inhibits the activity of the protein; and (c) for inducing an indunological response by inoculating the mammal with spo/rel protein, or a fragment or variant of it, adequate to produce antibody and/or in the response to protect the animal from disease. Conditions
as in (2); (4) DNA encoding a synthetic preproleader sequence that lacks the consensus N-linked glycosylation site NAT/S (x = ny codable anino acid other than P); and (5) the preproleader sequence. Expression vectors of (2) are used to produce (both express and secrete) polypeptides in yeast, e.g. insulin. insulin-like growth factor, glucagon or its fragments. The synthetic preproleader sequences are used to direct secretion of proteins from yeast cells. These LP provide high yield and more efficient recovery and/or purification of secreted proteins expressed in eukaryotic cells. The present sequence represents a specifically claimed leader peptide sequence of the present invention.
                                                                                                                                                                                                                                                                                                                           ö

This sequence is the E. coli glycerol dehydrogenase. The DNA can be used in a vector used in the method of the invention. The method is for the production of 1,2-propanediol (I), and comprises culturing a recombinant microorganism (A) that expresses enzymes(s) able to convert intracellular methylolyoxal (MG) to (I), in a medium convert intracellular methylolyoxal (MG) to (I), in a medium convert intracellular methylolyoxal (MG) to (I), in a medium companiety. Pharmaceuticals, confaining a sugar, other than a 6-deoxyhexose, as carbon source. (I) is used in manufacture of unsaturated polyester resins, inquid laundry detergents, pharmaceuticals, cosmetics, antiffreeze and de-icing compositions. By-products of the process (carbon dloxide, alcohols and compositions and provides production of (I) from renewable sources, without: (a) use of propylene oxide as intermediate; (b) generation of the convert waste; and (c) use of high temperature and pressure. Yields of (I) sequence 380 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Kluyveromyces yeast with modified protease gene - esp. used for high yield prodn. of recombinant protein, also DNA encoding yeast protease and derived peptide(s)
Disclosure: Page 31-33; 49pp; English.

The protease gene is to be modified in order to render it (partially) incapable of producing the natural protein; or result in a nonfunctional protease or in a protease with modified proteolytic activity. The modifications can be introduced in vitro or in situ by standard genetic engineering techniques or by exposure to mutagenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                    Fermentative production of 1,2-propanediol from simple sugars - using recombinant microorganism that expresses enzymes that convert extracellular methylglyoxal, also new transformants and synthetic
                     Glycerol dehydrogenase.

1.2 Proparated production; intracellular methylglyoxal conversion; unsaturated polyester resin; liquid laundry detergent; antifreeze; de icing composition; animal feed; glycerol dehydrogenase.

Claim 11; Page 26-28; 40pp; English.

The present sequence represents a spo/rel protein (spoT/relA family) which, consposing pneumoniae. The protein is of the spoT/relA family, which, in Escherichia coli, is involved in the stringent response to nutrient in Escherichia coli, is involved in the stringent response to nutrient considerable.

Inflation and regulate the accumulation of (p)ppGpp which is involved in the regulation of gene expression and other cellular processes.

Spo/rel proteins have a homology to e.g. S. equisimilis rel protein.

Spo/rel proteins can be used: (a) in the treatment of an individual in ceed of spo/rel protein, by administering to the protein to the patient;

(B) in the treatment of an individual having need to inhibit spo/rel protein, by administering an antagonist which inhibits the activity of inculating the mammal with spo/rel protein, or a fragment or variant of inculating the mammal with spo/rel protein, or a fragment or variant of it, adequate to produce antibody and/or T cell immune response to protect the animal from disease. Conditions which may be treated include otitis media, conjunctivitis, pneumonia, bacteraemia, meningitis, and compositions may be used as antibacterials.
                                                                                               ö

It may also be used to prevent hyperoxaluria. Hyperoxaluria is characterised by either abnormal synthesis or hyper-absorption of oxalate which can be prevented by edgrading the oxalate ions. This sequence can also be used to identify other molecules with similar blological activity, and may be used as an immunogen to produce specific antibodies. The CDNA that encodes this sequence may be used in gene therapy and also for chromosome identification, e.g. fluorescent in situ hybridisation (FISH) of a cDNA clone to a metaphase chromosomal spread.
                                                                                                                                                                                                                                                                                           ä

                                                                                                                                                             The polynucleotide was identified in a cDNA library derived from the human pancreas. It contains an open reading frame encoding the mature protein, which is about 50-60% homologous to the oxalyl-CoA decarboxylase from the bacterium oxalobacter formigenes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated polynucleotide encoding oxaly1-COA decarboxylase - useful for protein prodn. for treating hyper:oxaluria Claim 5: Page 34-36; Sopp; English.
This sequence represents human oxaly1-COA decarboxylase. Oxaly1-C
                        produce enzymes, which can be used to prevent urinary stone produce enzymes, which can be used to prevent urinary stone formation or treat or prevent hyperoxaluria claim 1: Columns 17-22: 20pp; English.

The present sequence is human oxaly1-CoA decarboxylase, which can be used to prevent or treat hyperoxaluria or urinary stone formation by reducing the plasma or urinary levels of oxalate ion. The enzyme or the polymucleotide encoding it can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                           ;;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             'n

Disclosure; Page 42-47; 60pp; English.

This sequence represents the human apoliporptoein B-100 (apoB-100).

Tragments of this sequence can be used in the peptide of the invention, which has the formula (1), or their variants with one or more internal deletions, insertions or substitutions, while retaining anti-coagulant properties of apolipoprotein B-100 (apoB-100).

Tragments of apolipoprotein B-100 (apoB-100).

Tragments of apolipoprotein B-100 (apoB-100).

The N terminus of the peptide, or 1-47 amino acids (aa);

The Campositions containing the peptide are used for simultaneous, separate or sequential treatment of cancer, particularly to prevent metastatic spread. They are also used to inhibit thromboplastin-mediated processes, surgery or in cases of heart attack, stroke etc.) and to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        form lipo-peptide complex
Claim 50; pp73-85; 123pp; English.
ApoB is a lipid-binding peptide adapted to bind to phospholipids at
one or more amphipatic alpha-helical peptide regions. ApoB gene is
pref. expressed in Chinese hamster ovary (CHO) cells and the gene is
introduced in an expression vector having a regulatable promoter
derived from the human metallothionein II gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

To produce rifamycin and rifamycin analogues

Claim 6; Page 126-151; 205pp; English.

The present sequence represents a Amycolatopsis mediterranei rifamycin

Synthesis gene cluster ORF B protein from the present invention. The

DNA fragment comprises a DNA region involved directly or indirectly

in the gene cluster responsible for rifamycin synthesis, including

their function in connection with rifamycin biosynthesis, qualify

a constituents of this rifamycin gene cluster, and functional

fragments, derivatives or constituents of these. The Amycolatopsis

mediterranei rifamycin synthesis gene cluster DNA fragment can be used

for producing rifamycin, rifamycin analogues or precursors. It can also

be used for inactivating or modifying genes involved in ansamycin or

rifamycin biosynthesis. The DNA can be used for constructing mutant

critinomycetes strains from which the natural rifamycin or ansamycin

biosynthesis gene cluster has been partly or completely deleted. The

DNA fragment can be used for assembling a library of polyketide

crimonomycetes, which can be used for assembling a library of polyketides

synthases, which can be belosynthesis of ansamycins.
angiogenesis, cellular differentiation or apoptosis. KRAD-14, which is active as such or as part of a 98-aa peptide, inhibits activation of the prothrombinase complex; and prevents activation of factor VII on the surface of thromboplastin and of platelets by thrombin. It binds to the residues 58-66 of thromboplastin. Since (I) are much smaller than apoB-100, they act more quickly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

New Proper Taylors.

New Proteins derived from T4 phage tail fibre proteins - that can self assemble into nano-structure(s), useful as filters etc, also corresponding DNA

Claim 7: Fig 7: 83pp; English.

Claim 7: Fig 7: 83pp; English.

A protein (R97371) of unspecified function is the product of open reading frame x of the tail fibre protein gene region (see also C T9083) of phage T4. This gene region also includes open reading frames for tail fibre proteins (see also P8737071) of that the proteins (see also P8737071) of quantities in maturobial cells and used as building blocks of strong, general contractions and the produced in large contractions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           08-JUL-1991; JP-193471.

#title A phosphoglycerate Kinase-like molecule localized to
glycosomal microbodies: evidence that the topogenic signal
is not at the C-terminus.
